

SMALL SOFTWARE. RIGHT AT HOME.

The deploy and governance layer for the tools agents make.

App generation got cheap. The last mile did not.

A five-person operations tool can be built in an afternoon. It still needs a URL, an owner, access rules, versions, and a way to undo a bad release.

01 Build

02 Deploy

03 Share

04 Govern

Lower effort

Higher operational weight

Prototype or production is the wrong choice.

Generated tools

Fast to make. Hard to own.

Oikina apps

Small enough to move fast.
Controlled enough to keep.

Enterprise stacks

Controlled. Too heavy for five users.

The build moment is commodity. The last 80 seconds are the product.

01

Agent writes

Any coding agent can create the app.

[AGENT ECOSYSTEM](#)

02

Deploy

The CLI validates and publishes the build.

[LIVE TODAY](#)

03

Stable URL

The app gets a persistent Oikina hostname.

[LIVE TODAY](#)

04

Share

App-user identity and team access.

[PRODUCT TARGET](#)

05

Roll back

The operator restores a known release.

[LIVE TODAY](#)

A home for small software.

OIKINA IS

- 01 A runtime for agent-built internal apps
- 02 A deploy target for any coding agent
- 03 A lifecycle system for versions and rollback
- 04 A governance layer that IT can inspect

OIKINA IS NOT

- × Another prompt-to-app builder
- × A general cloud replacement
- × A low-code canvas with chat attached
- × Arbitrary public code hosting

A narrow slice. Already real.

● Immutable content-addressed artifacts	LIVE
● Scoped deploy credentials	LIVE
● Release history and rollback	LIVE
● Operator Console	LIVE
● App-user identity and RBAC	NOT YET
● Server execution, data, jobs, secrets	NOT YET

CONTROL

Every deploy leaves a trail.

The live control-plane slice records release metadata, keeps the active pointer explicit, and gives the operator a safe way back.

One small cloud, in one package.

 Data Typed application state, provisioned without setup.	 Auth Organization identity and app permissions.	 Files App-owned storage behind the same contract.	 Jobs Scheduled work and controlled webhooks.	 Secrets Opaque references, never browser values.	 Notify Approved actions into team channels.
--	---	---	--	--	---

Same app contract. Inside the customer boundary.

The control plane sends releases and policy intent. The Private Runtime keeps execution, app data, secret values, and network enforcement in the customer environment.

Built for small, serious work.

01 Field incident trackers OPS	02 Exception dashboards CSV	03 Approval queues OK
04 Internal data collection IN	05 Lightweight team trackers CRM	06 Evaluation workbenches AI

The agent is the interface. Oikina is where the work lands.

API

CLI

MCP

Oikina does not need to win the model race. A narrow app contract and agent-facing tools can turn every coding agent into a way in.

Prove the contract. Move the boundary.

NOW	HOSTED V0	NEXT	FULL-STACK V1	THEN	PRIVATE RUNTIME
Make static deploys reliable and reversible. CLI and Hosted Runtime Stable app hostnames Scoped deploy credentials Release history and rollback	Add the small-cloud primitives. Server actions Per-app data and files App-user authentication Protected secret references	Run the contract in customer cloud. Runtime enrollment Identity integration Private service bindings Policy and audit controls			

THE TOOL IS ALREADY BUILT. NOW MAKE IT BELONG.
